

AVL List GmbH (Headquarters)

Getting the Best Out of Electrification Through Good System Integration

11th CIMAC CASCADES

**Dr. Klaus Hadl,
Robert Strasser**

Agenda

- Hybridization & Electrification of Ships
- Virtual System Integration & System Simulation
- Use Case: Hybrid Tug Boat

Agenda

- Hybridization & Electrification of Ships
- Virtual System Integration & System Simulation
- Use Case: Hybrid Tug Boat

Hybridization & Electrification of Ships

Motivation for Maritime Applications

Environmental Responsibility

Emission free missions, pure electric operation, e.g. ferries

Legislation

Focus of public & politics, new local legislation, e.g. inland shipping

Efficiency Improvement

Sweet spotting, part-load operation, e.g. tug boats

Hybridization & Electrification of Ships

Motivation for Maritime Applications

Environmental Responsibility

Emission free missions, pure electric operation, e.g. ferries

Legislation

Focus of public & politics, new local legislation, e.g. inland shipping

Efficiency Improvement

Sweet spotting, part-load operation, e.g. tug boats

Component Protection

Peak shaving, e.g. dredging ships with sudden load steps

Transient Behavior

Manoeuvring & dynamic positioning, e.g. OSV

Redundancy of Propulsion & Energy System

Safety, reliability, availability

Acoustic & Thermal Signature

Defense applications

Silence & Comfort

Luxury yachts

Hybridization & Electrification of Ships

Examples of Maritime Applications

Fully Electric
Ferry

Hybrid Tug
Boat

Hybrid
Offshore-
Supply Vessel

Hybrid Yacht

Agenda

- Hybridization & Electrification of Ships

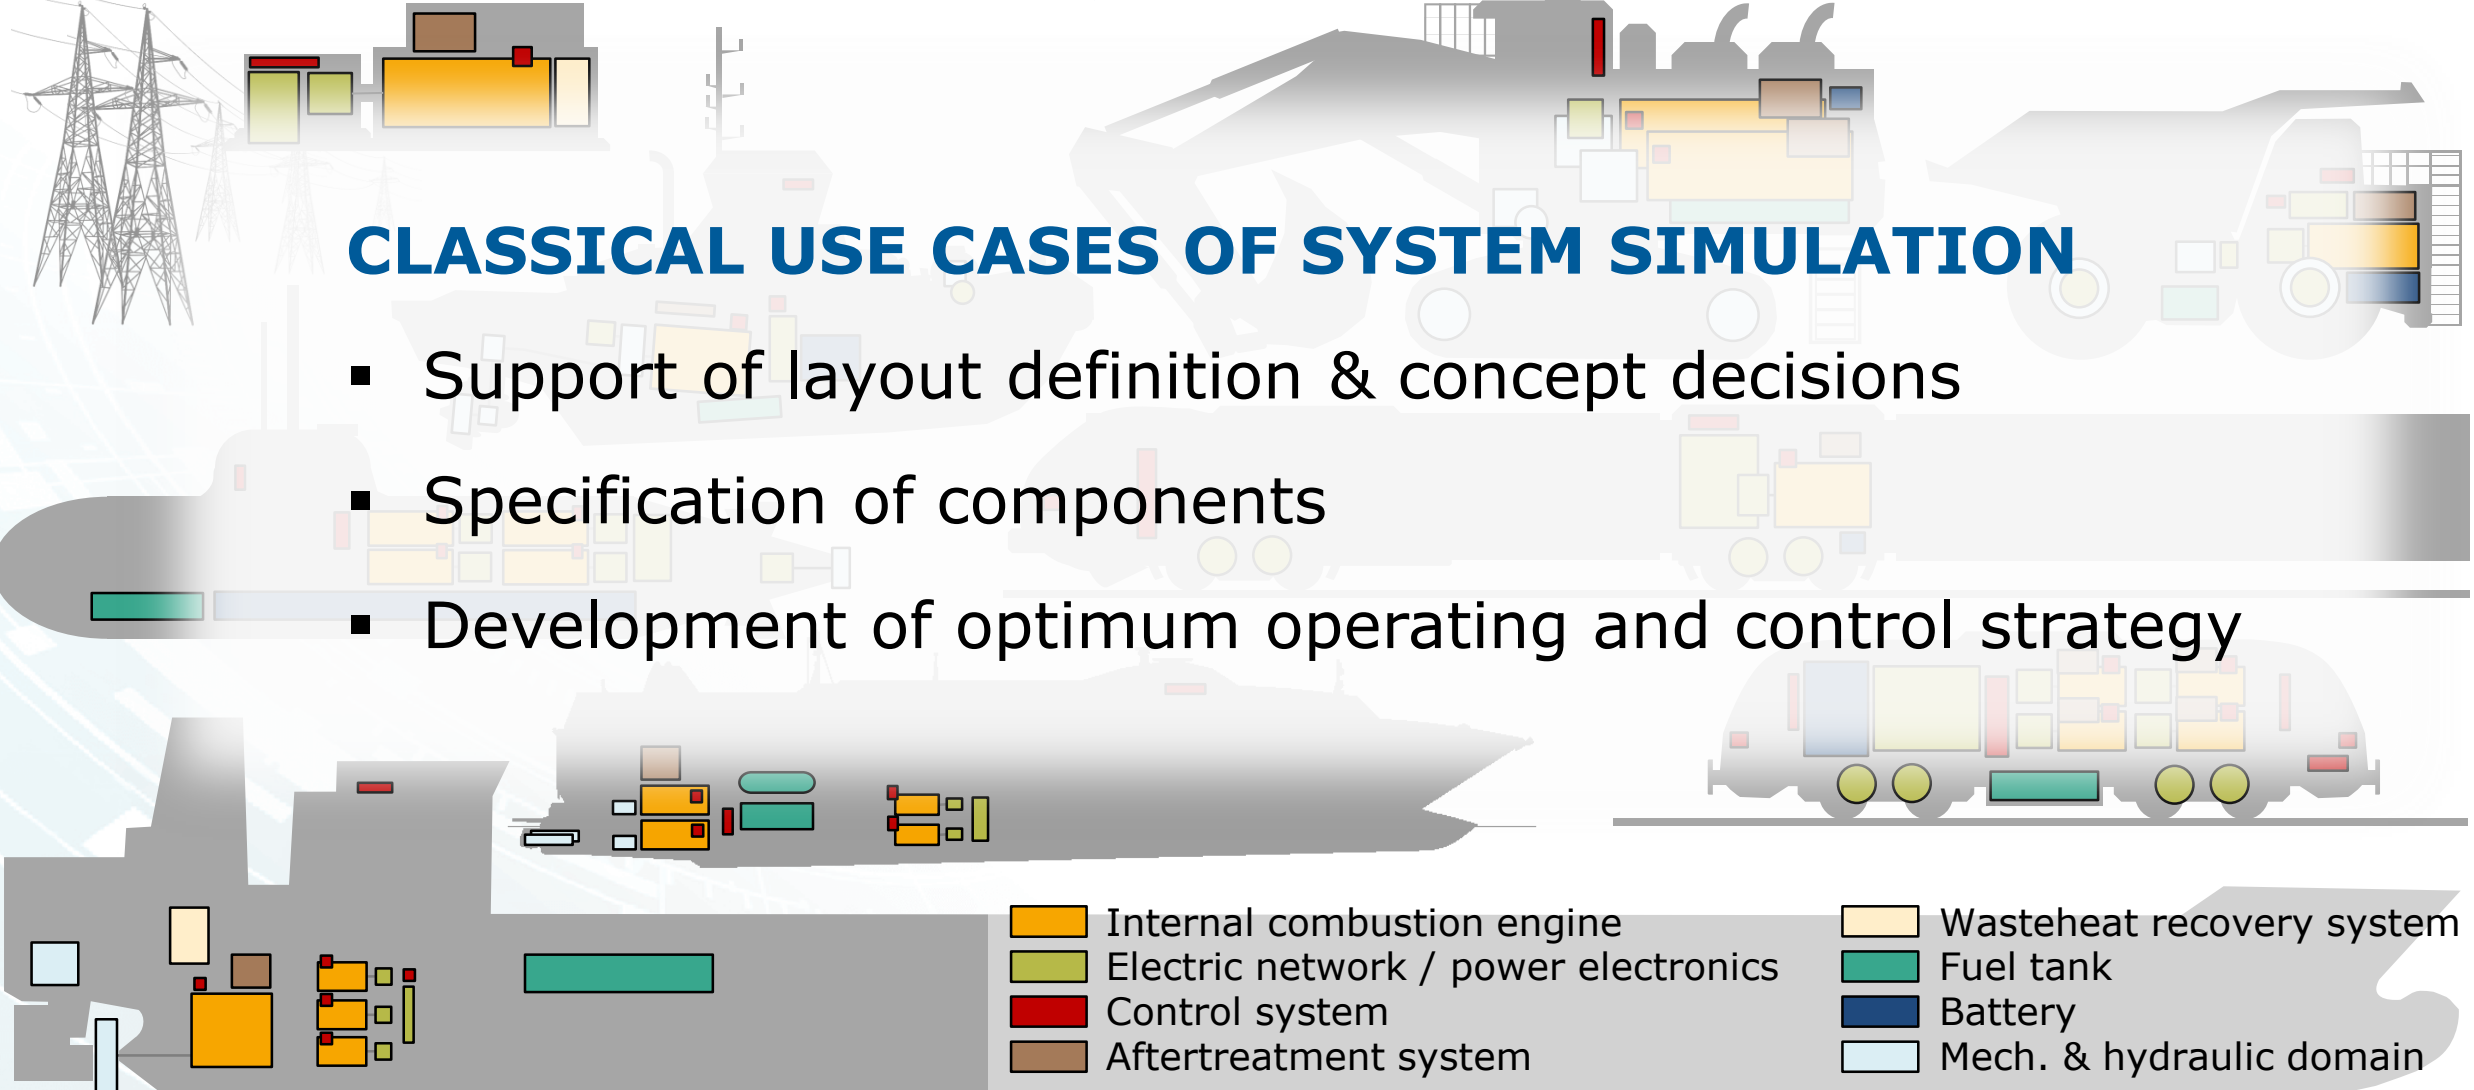

- Virtual System Integration & System Simulation

- Use Case: Hybrid Tug Boat

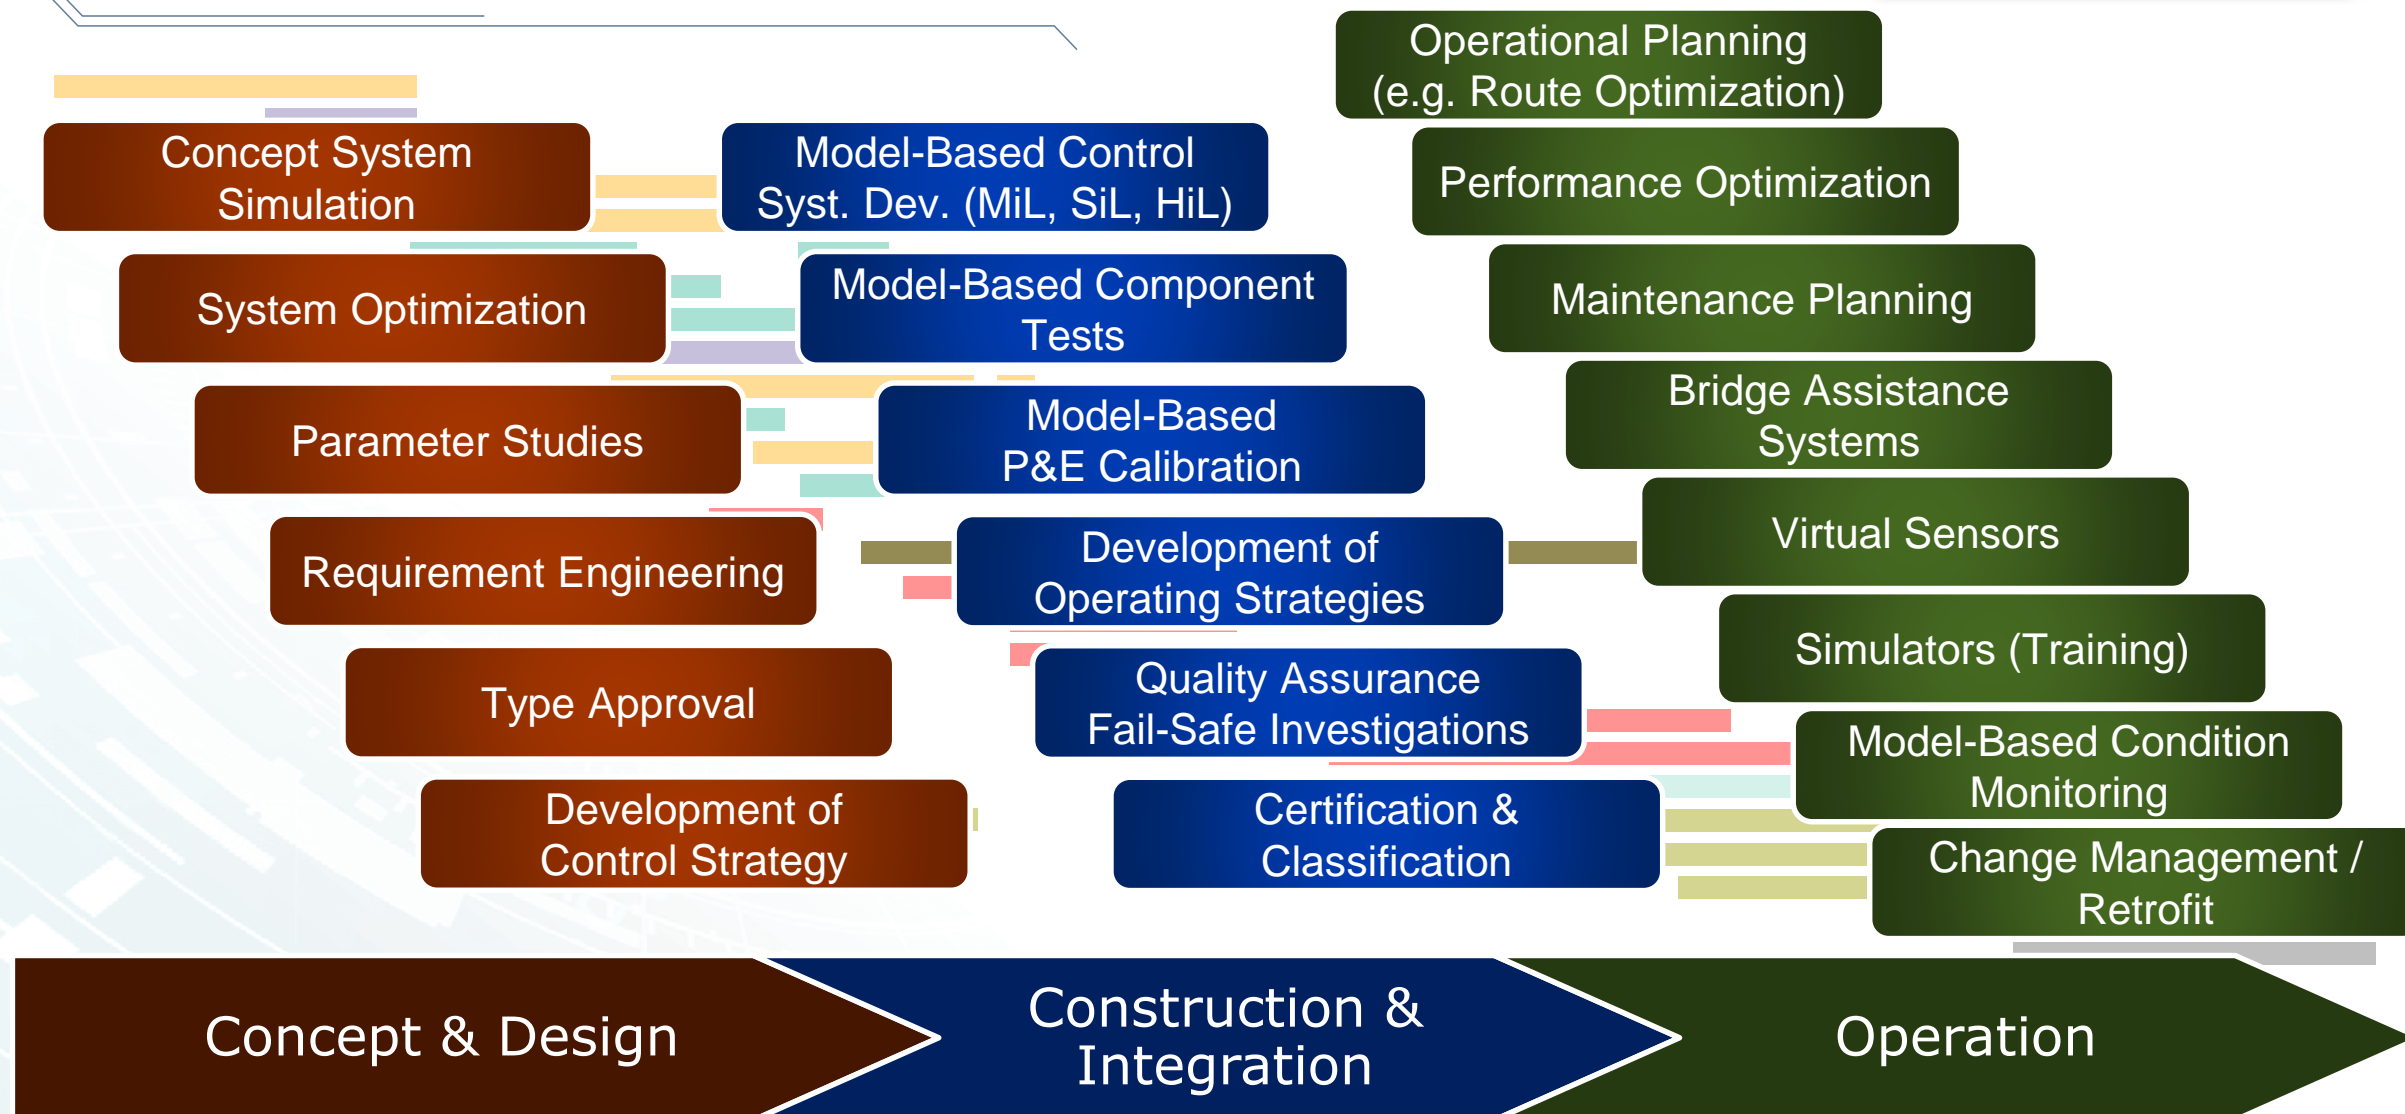

Virtual System Integration & System Simulation: System Complexity

CLASSICAL USE CASES OF SYSTEM SIMULATION

- Support of layout definition & concept decisions
- Specification of components
- Development of optimum operating and control strategy

Virtual System Integration & System Simulation: Use Cases

Virtual System Integration & System Simulation: Co-Simulation

Modelling Tool	AVL CRUISE™ M 	AVL Model.CONNECT™ 
Simulation Tool		
Co-Simulation Platform		

AVL CRUISE™ M: Wide range of Modelling and Simulation applications!

Requirements for Co-Simulation Platform

- Supporting industry standards such as FMI
- Integration of testing world, virtual testbeds
- Local & distributed co-simulation
- Advanced coupling & synchronization techniques
- Elimination of co-simulation errors

Virtual System Integration & System Simulation: AVL Cruise™ M

AVL CRUISE™ M
MULTI-DISCIPLINARY SYSTEM SIMULATION

MECHANICAL SYSTEM

DRIVETRAIN &
PROPULSION SYSTEM

CONTROL DOMAIN

ALL TYPES OF ENGINES

LIQUID FLOW

EXHAUST GAS
AFTERTREATMENT SYSTEMS

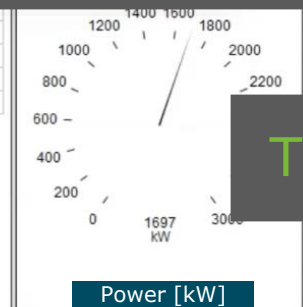

IMPORT & EXPORT
INTERFACES

THERMAL SYSTEM

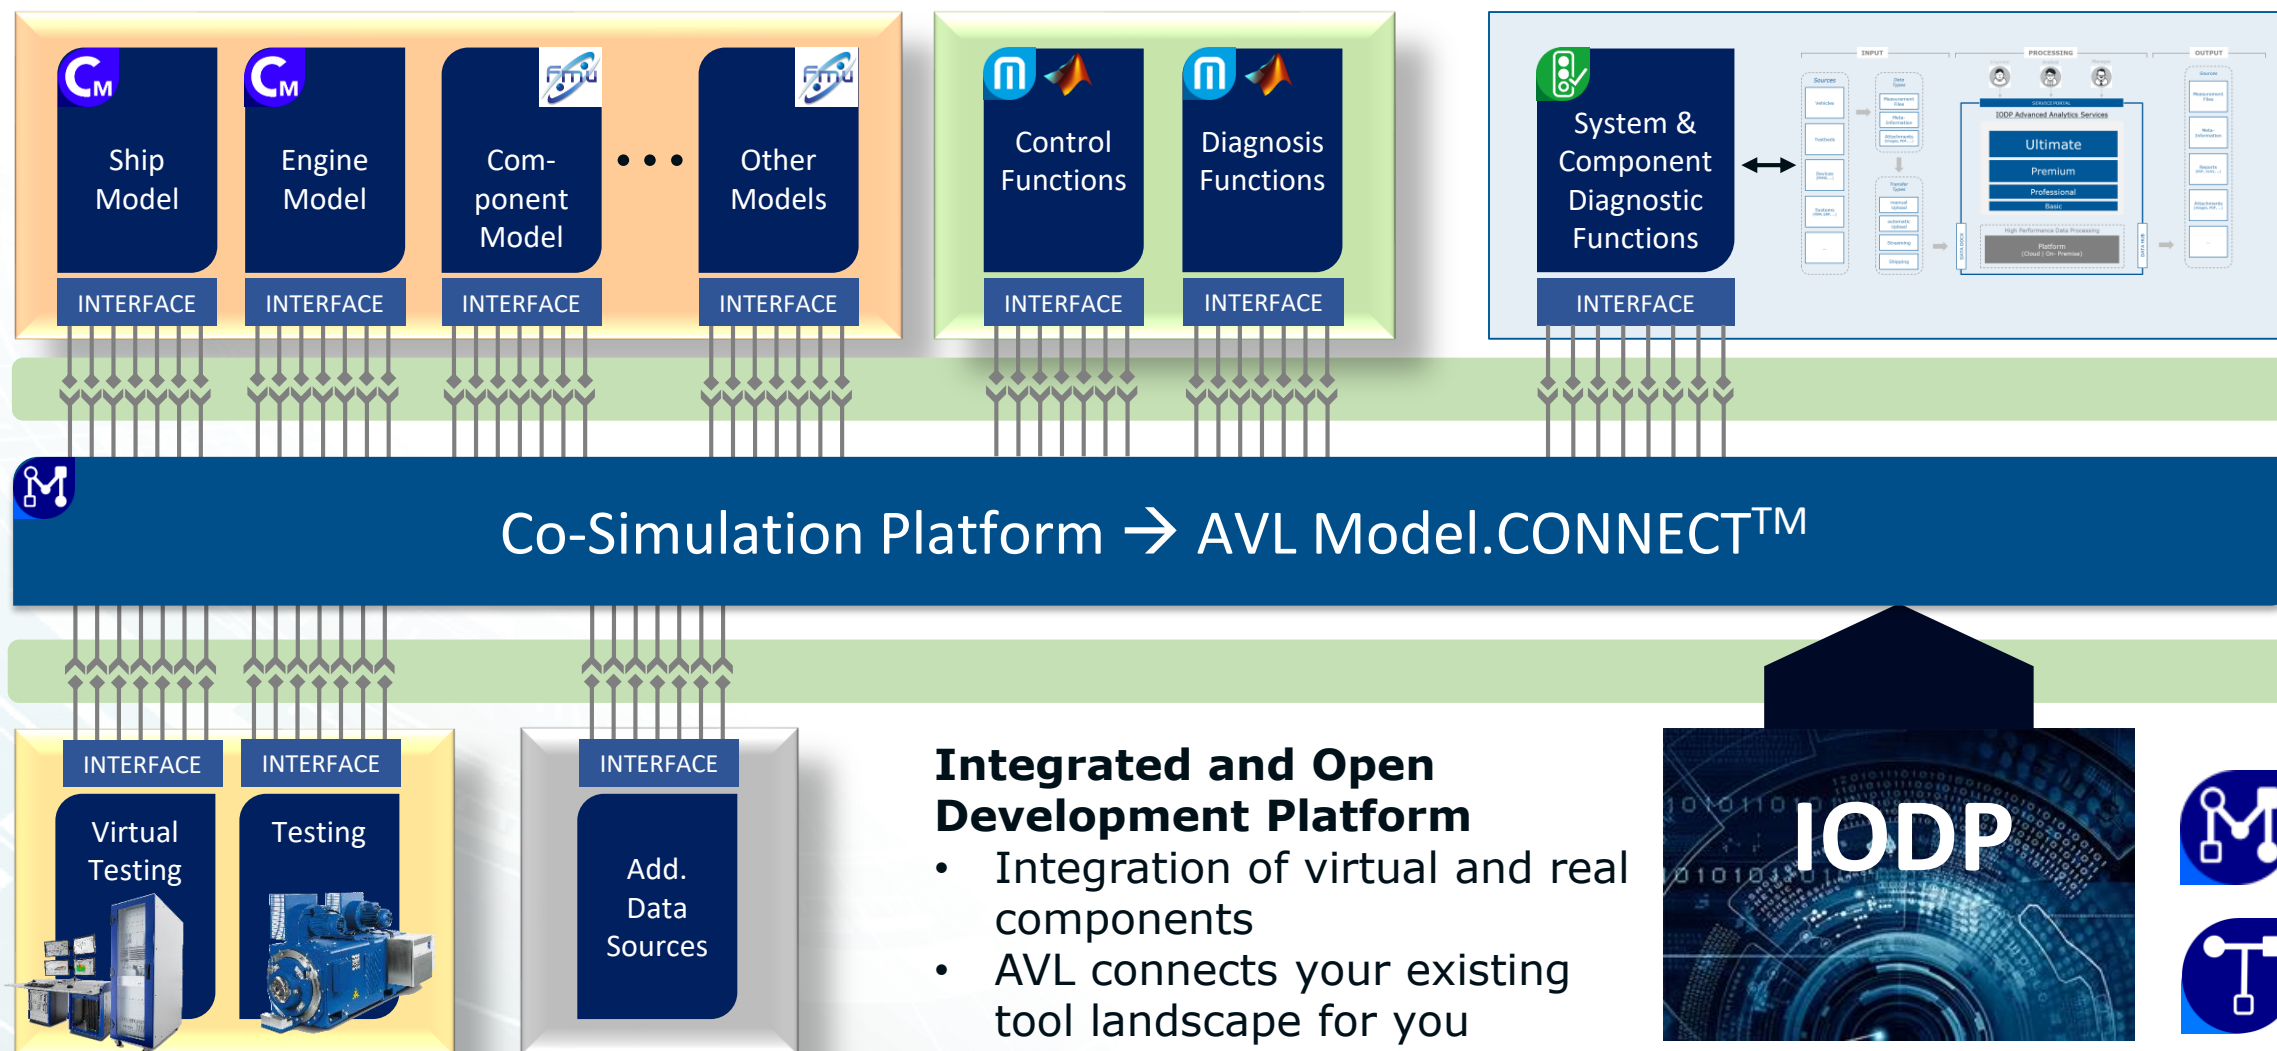

ELECTRIC DOMAIN & FUEL CELL

Speed	1000	rpm
BMEP	14.17	bar
Intake...sure	2.649	bar
BSFC	208.82	g / (kW-h)
BSNOx	5.8	g / (kW-h)

Virtual System Integration & System Simulation: Platform Architecture

Integrated and Open Development Platform

- Integration of virtual and real components
- AVL connects your existing tool landscape for you

Agenda

- Hybridization & Electrification of Ships
- Virtual System Integration & System Simulation

- Use Case: Hybrid Tug Boat

Use Case: Hybrid Tug Boat

Introduction Hybridization Example

OBJECTIVES OF PROJECT

- Definition of hybrid concept
- Specification of components (engine, e-machines, batteries etc.)
- Optimization of operating strategy for given operating profile/duty cycle

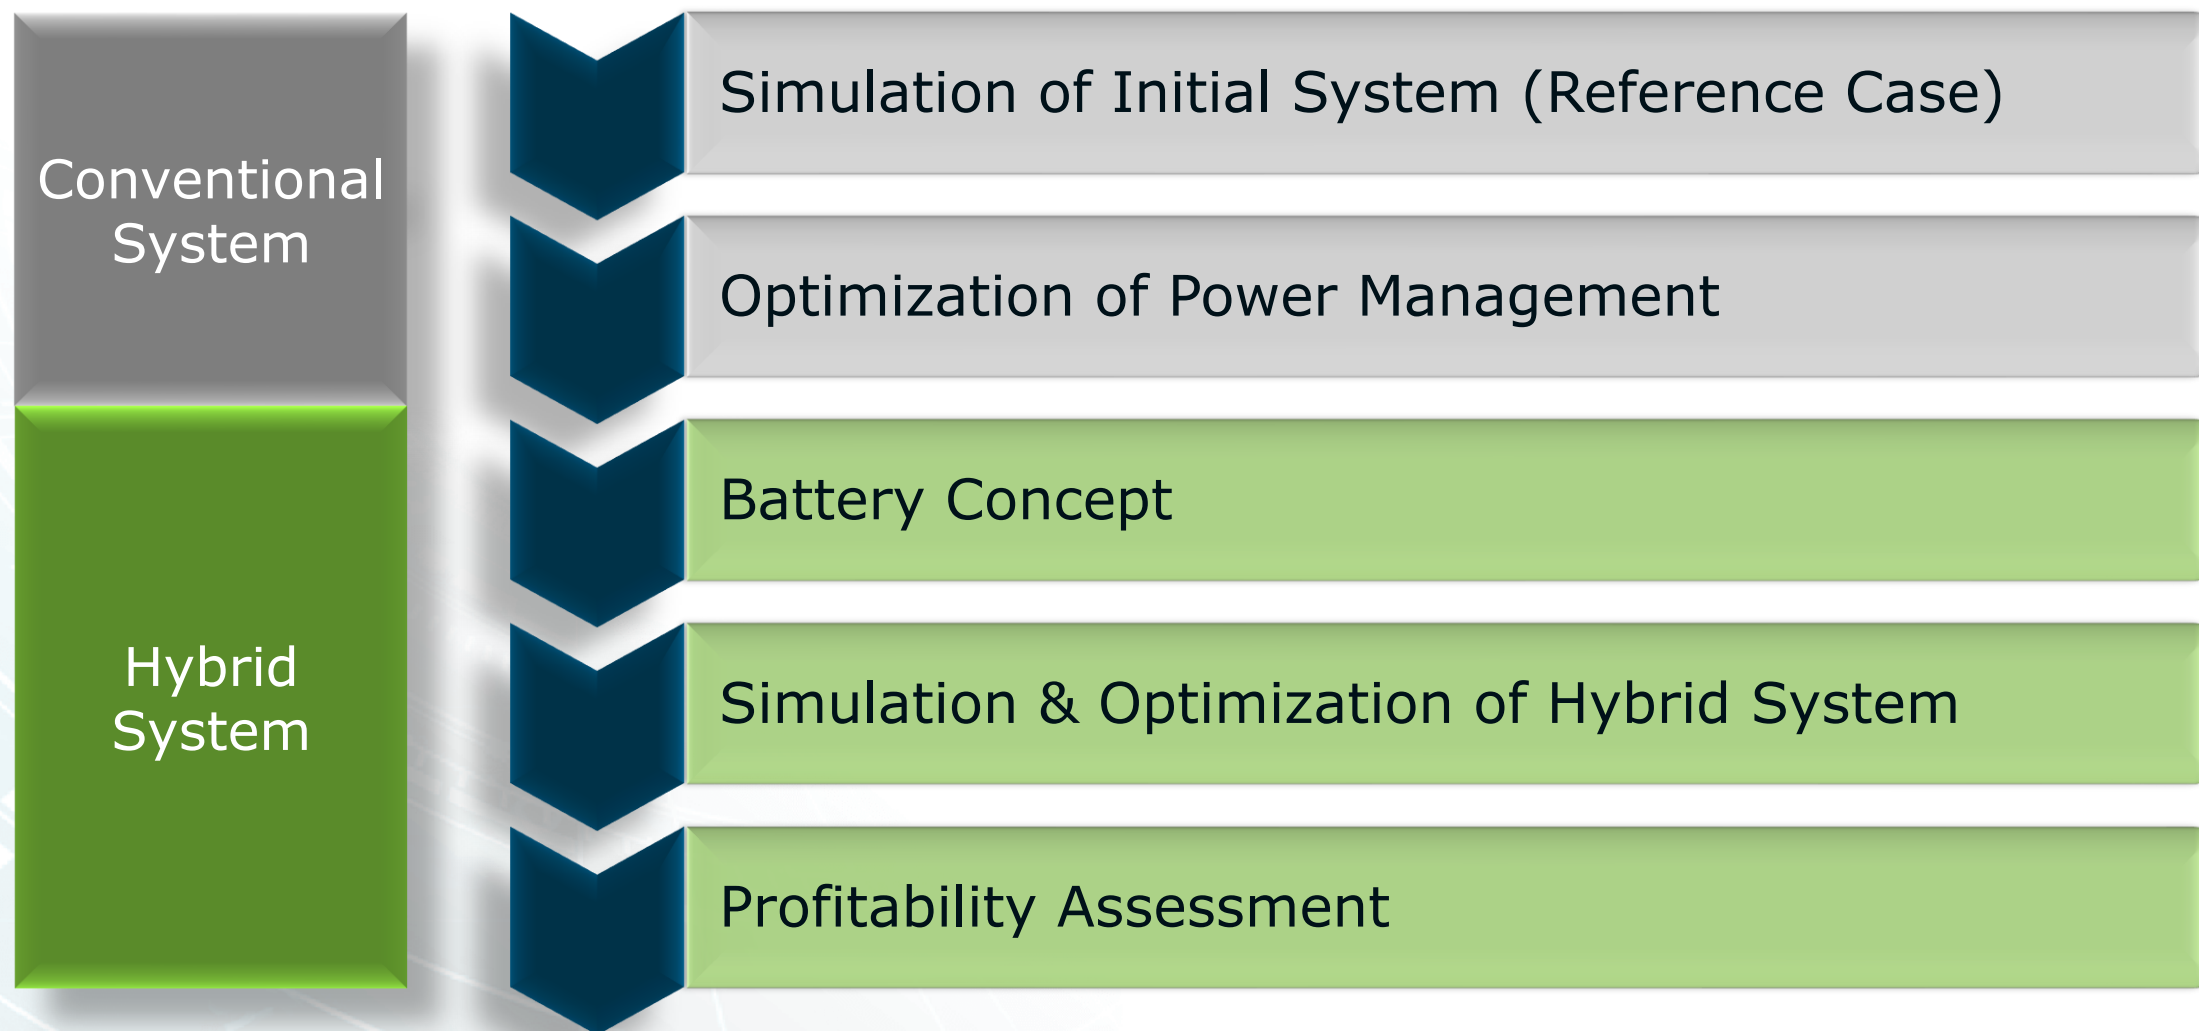

High system complexity

Use Case: Hybrid Tug Boat

Flow Chart– Concept Investigations

Use Case: Hybrid Tug Boat

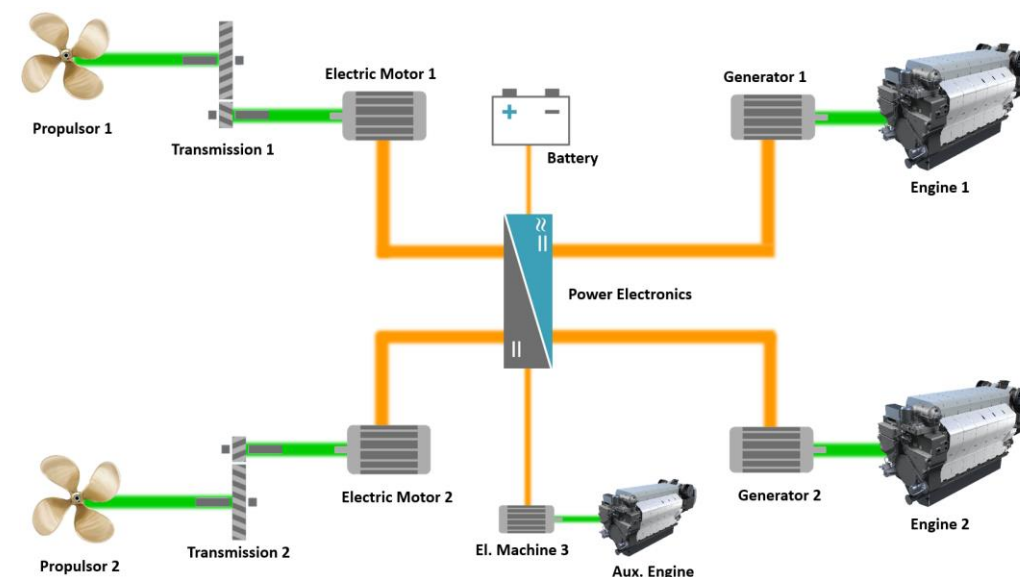

Concept Investigations Hybrid System

DIESEL/GAS-MECHANIC CONCEPT

- Diesel/gas-mechanic propulsion system
- Parallel hybrid concept with clutch
- Additional e-motors & battery
- Option: onshore plug-in

DIESEL/GAS-ELECTRIC CONCEPT

- Diesel/gas-electric propulsion system
- ICE as genset
- Battery as additional energy source
- Option: onshore plug-in

Use Case: Hybrid Tug Boat

Battery Concept: Cell Chemistry Comparison

Active Material		Voltages Nominal	Specific Energy	Specific Power	Safety	Performance	Life Span	Cost
Lithium Cobalt Oxide (LiCoO ₂)	LCO	3.6 V	150 – 200 Wh/kg					
Lithium Manganese Oxide (LiMn ₂ O ₄)	LMO	3.7 V	100 – 150 Wh/kg					
Lithium Nickel Manganese Cobalt Oxide (LiNiMnCoO ₂)	NMC	3.6 V	150 – 220 Wh/kg					
Lithium Iron Phosphate (LiFePO ₄)	LFP	3.3 V	90 – 120 Wh/kg					
Lithium Nickel Cobalt Aluminum Oxide (LiNiCoAlO ₂)	NCA	3.6 V	200 – 260 Wh/kg					
Lithium Titanate Oxide (Li ₄ Ti ₅ O ₁₂)	LTO	2.4 V	30 – 110 Wh/kg					

Use Case: Hybrid Tug Boat

Battery Concept: AVL Battery Test Center

AVL Battery Test Center

AVL Battery Test Center:

- Equipment for different cell types
- Cell validation
- Hardware in the loop test facilities for battery controls calibration
- Durability test cells
- Calendric ageing test cells

Use Case: Hybrid Tug Boat Simulation & Optimization

Battery & Cell Testing

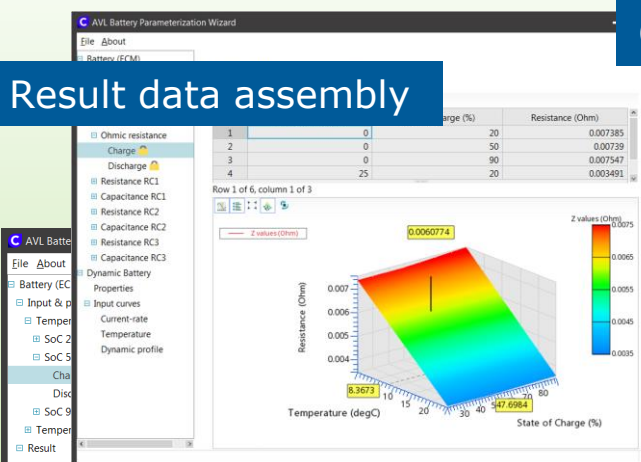

Dynamic data for
charge and discharge

Discharging T = 25 °C, SoC = 90 %
Discharging T = 0 °C, SoC = 20 %
Charging T = 25 °C, SoC = 20 %
Charging T = 25 °C, SoC = 50 %
Charging T = 25 °C, SoC = 90 %
Charging T = 0 °C, SoC = 20 %

Battery Parametrization Wizard

Result data assembly

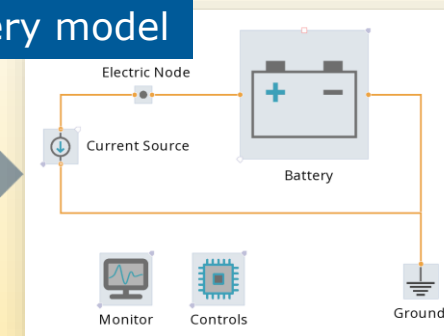

Automated data regression to
calculate parameters of RC-pairs

Battery Model

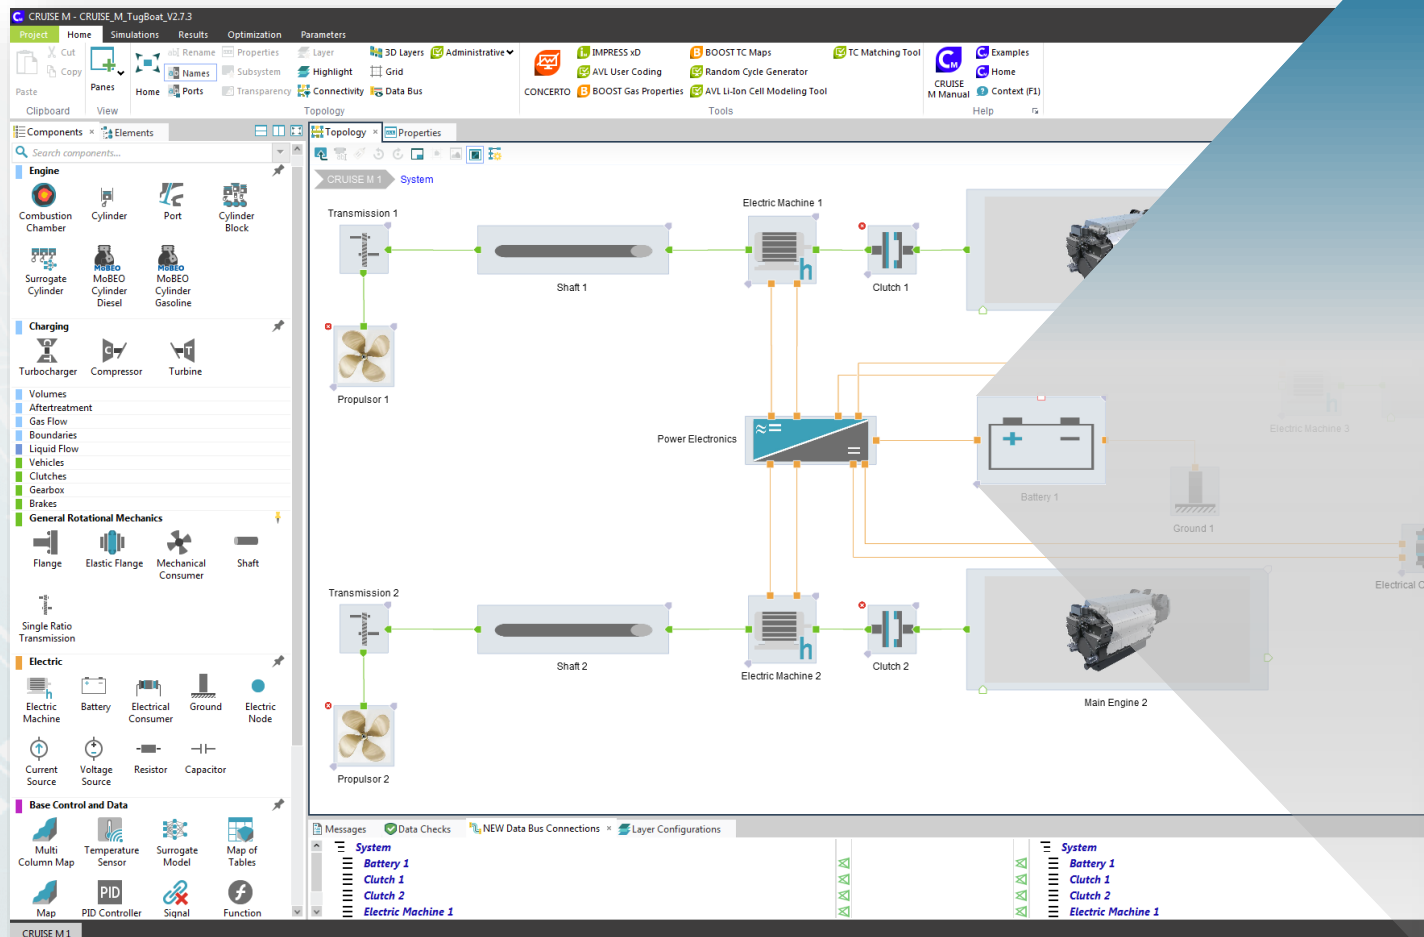

Direct transfer to
CRUISE M battery model

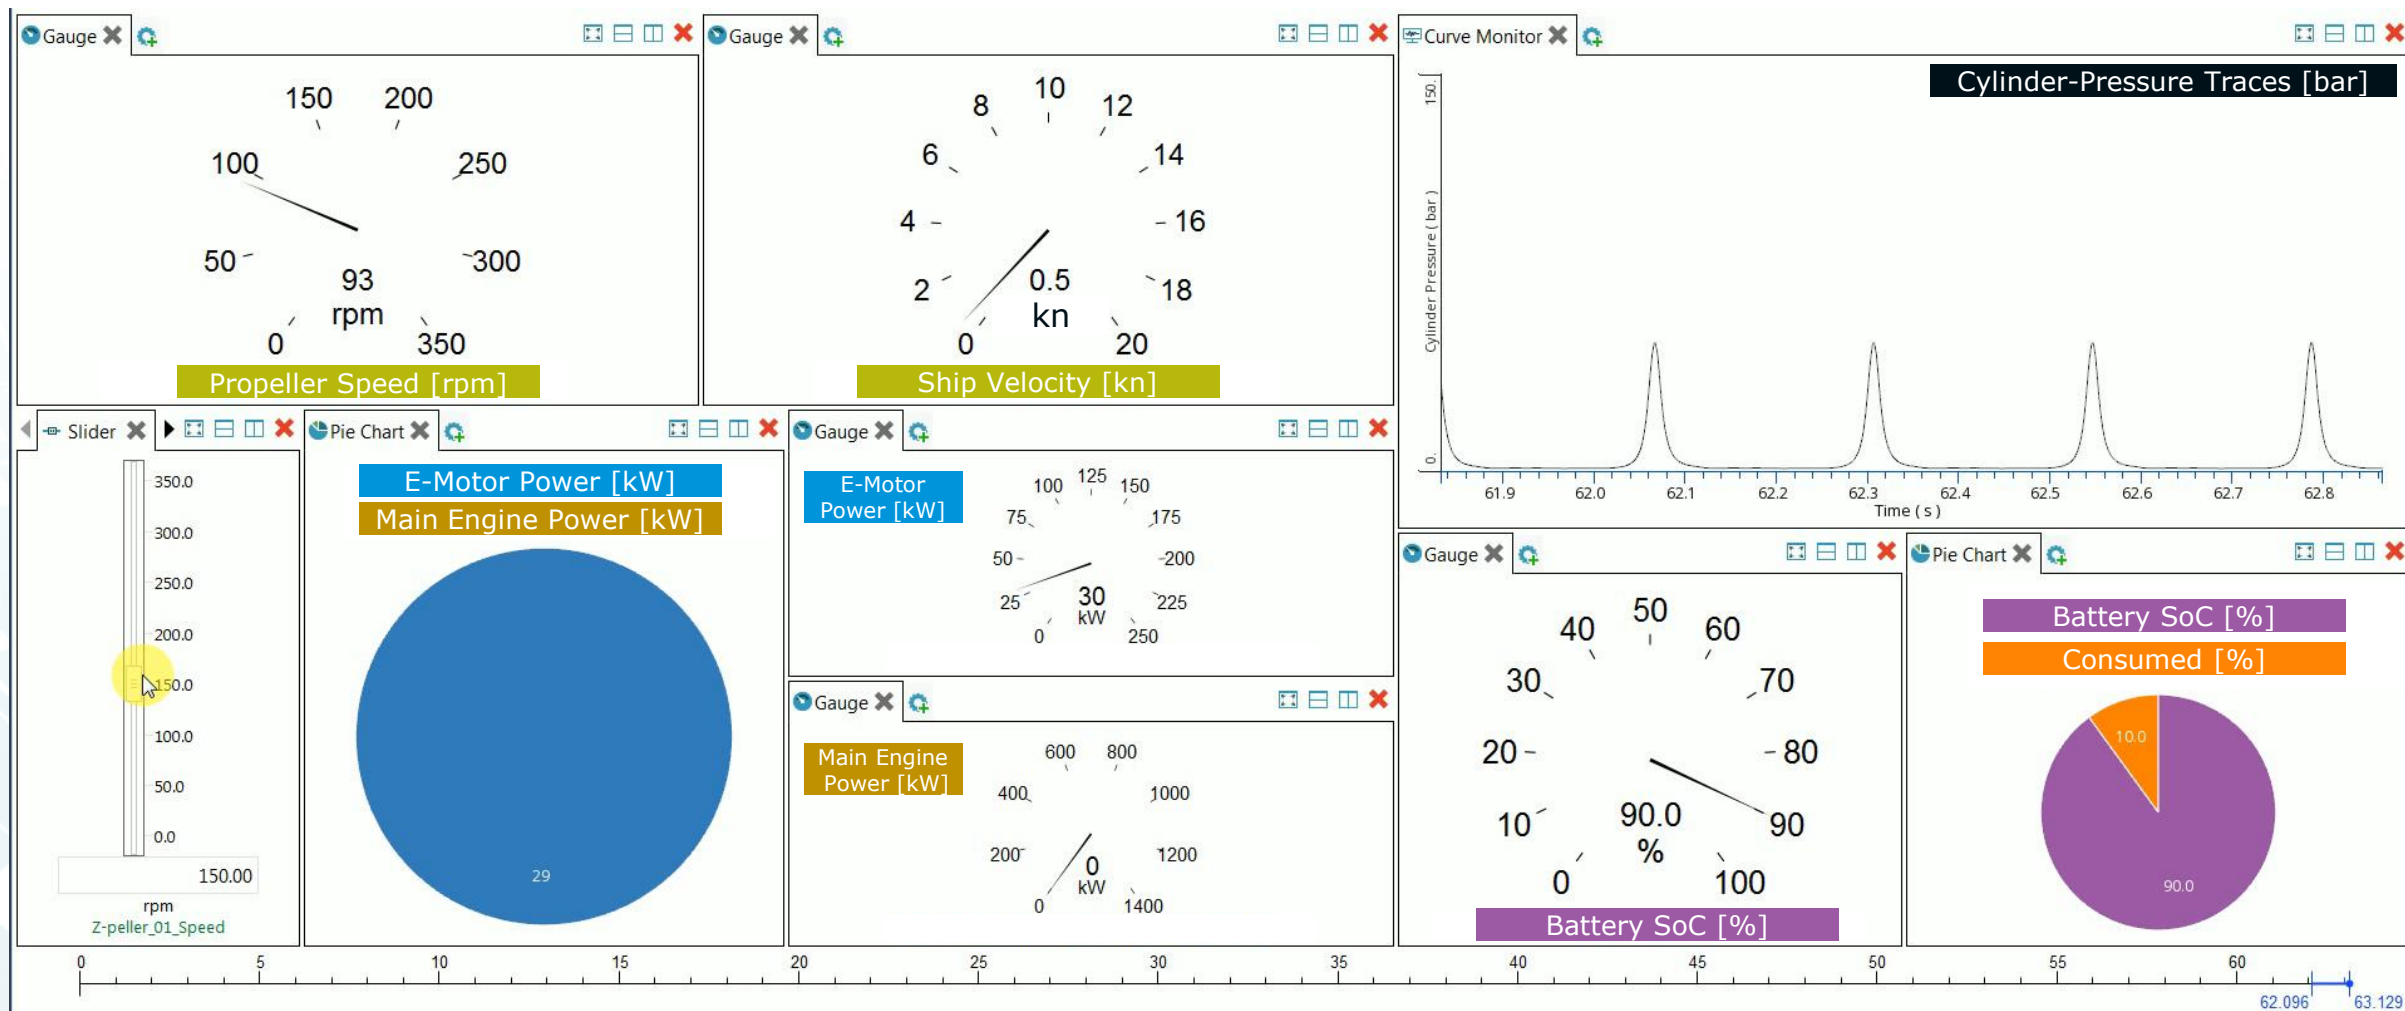

Use Case: Hybrid Tug Boat Simulation & Optimization: Battery Model

AVL CRUISE™ M

Virtual System Integration & System Simulation: Simulation for Hybridization

Use Case: Hybrid Tug Boat

Results of the Investigation

BOUNDARY CONDITIONS

2 x 1800 kW for propulsion and
450 kVA of auxiliary engine

Operating profile

Fuel cost (LSMGO 310 €/mt)

Electricity cost (2.55 Ct/kWh)

Battery capacity: 246 kWh

CONCLUSIONS

Diesel-mechanical system with parallel hybrid configuration and clutch:
fuel saving potential ~ 7%

Diesel-electric system with batteries:
fuel saving potential ~ 4%

Cheap onshore power during docking,
plug-in charging of batteries: **reduction of energy cost up to 30%**
(→ „smart charging concepts“)

Operating profile has major influence on fuel saving potential

System simulation is a valuable tool for optimizing numerous variants under different boundary conditions

Intelligent hybrid management system & predictive control system

Conclusions

- **Hybrid & electric solutions:** attractive to reduce the environmental impact of the operation of various maritime applications.
- **System simulation:** valuable instrument to investigate and optimize the operation of vessels.
- The high added value of system simulation as part of the virtual system integration results from the **integrative and consistent application of models** in the entire development process and also in the operation of a system.
- Innovative platforms allow the **integration of virtual and real components**.
(AVL's Integrated and Open Development Platform)
- In the future, virtual system integration & model-based development methods will be increasingly used. AVL deals with various **virtual approaches for maritime applications**, to **give a valuable contribution to the design, construction and operation of maritime applications**.
